

Data sheet

Safety pressure reduction controller SAVD (PN 25)

Description

The controller has a control valve, an actuator with two control diaphragms and a spring(s) for pressure setting.

Design-tested according to DIN EN 4747-1 and AGFW guidelines FW 504.

Main data:

- DN 15-50
- k_{VS} 4.0-25 m³/h
- PN 25
- Setting range:
1-5 / 2-8 / 3-12 bar
- Temperature:
 - Circulation water/glycolic water up to 30 %: 2 ... 150 °C
- Connections:
 - Ext. thread (weld-on, ext. thread and flange tailpieces)
 - Flange

SAVD is a self-acting safety pressure reduction controller primarily for use in district heating systems. The controller is normally opened and closes on rising pressure. It is used for pressure reduction control and as a protection against excess pressure behind the valve.

Ordering

Example:
Safety pressure reduction controller,
DN 15, k_{VS} 4.0; PN 25, setting range
1-5 bar, T_{max} 150 °C, ext. thread

- SAVD DN 15 controller
Code No: **003H6693**

Option:
- Weld-on tailpieces
Code No: **003H6908**

The controller will be delivered
completely assembled, inclusive
impulse tube between valve and
actuator.

Application principles

Installation positions

Up to medium temperature of 100 °C the controllers can be installed in any position.

For higher temperatures the controllers have to be installed in horizontal pipes only, with a pressure actuator oriented downwards.

Pressure temperature diagram

Sizing

Safety pressure reduction controller has to control 5.0 bar behind the controller. Max. flow through the system is less than 2.2 m³/h, min. flow pressure is 6.2 bar.

Given data:

$$Q_{\max} = 2.2 \text{ m}^3/\text{h}$$

$$p_{1 \text{ min}} = 6.2 \text{ bar}$$

$$p_{\text{reduced}} = 5 \text{ bar}$$

Nominal pressure PN 25

The min. differential pressure across the controller is calculated from the formula:

$$\Delta p_{\text{SAVD}} = p_{1 \text{ min}} - p_{\text{reduced}} = 6.2 - 5.0$$

$$\Delta p_{\text{SAVD}} = 1.2 \text{ bar}$$

$$k_v = \frac{Q_{\max}}{\sqrt{\Delta p_{\text{SAVD}}}} = \frac{2.2}{\sqrt{1.2}}$$

k_v value is calculated according to formula:

$$k_v = 2.0 \text{ m}^3/\text{h}$$

Solution:

The example selects SAVD DN 15, k_{vS} value 4.0; with pressure setting range 1-5 bar.

Sizing of Safety Valve SV or Safety Pressure Relief Valve SÜV

If pressure protection is performed by a safety pressure reduction controller (SAV) the downstream safety units (safety valve SV or safety pressure relief valve SÜV) must be designed for a flow rate of at least 1 % of the k_{vS} value of the safety pressure reduction controller (SAV). More details see in standard DIN 4747-1.

Design

1. Valve body
2. Valve insert
3. Pressure relieved valve cone
4. Valve stem
5. Safety diaphragm
6. Control diaphragm
7. Setting spring for pressure control
8. Adjuster for pressure setting, prepared for sealing
9. Union nut
10. Connection stem
11. Air space bore
12. Upper casing of diaphragm
13. Lower casing of diaphragm
14. Threaded joint with sintering filter
15. Impulse tube

Function

Mode of Operation

The safety pressure reduction controller controls the pressure and protects the system against excess pressure behind the valve. The valve cone is softsealed and pressure balanced.

Control function

The pressure behind the control valve is being transferred through the impulse tube into the lower (+) chamber of the control diaphragm. The pressure generates a force on the control diaphragm which counteracts the force of the setting spring. This difference in forces act through the connection stem and the valve stem upon the valve cone. The valve closes when the pressure behind the valve rises and opens when the pressure decreases.

Safety function in case of diaphragm break

If the control diaphragm breaks, pressure gets in the two intermediate chambers. This pressure acts upon the safety diaphragm and causes the valve to close. The control function does not operate. A slight water leakage at the threaded joint on the safety diaphragm indicates a break of the control diaphragm.

Settings

Pressure setting

Pressure setting is being done by the adjustment of the setting spring for pressure control. The adjustment can be performed on the basis of pressure adjustment diagram (see relevant instructions) and/or pressure indicator.
