# RHDE1250 / RHDE2500 (Contrac)

Electrical rotary actuator

For continuous control mode in explosion-proof design, nominal torque 1250 / 2500 Nm (925 / 1850 lbf ft)

**Explosion protection acc. to ATEX** Electrical actuator for continuous positioning, three-point position control, or bus control Stall-proof without the need for position- or torque-dependent shut-off Three-phase asynchronous motor, flameproof enclosure Connection spaces with increased safety Highly efficient and sturdy gear unit Control via separate, processor-controlled electronic unit

Power supply 115 V AC oder 230 V AC via electronic unit only

## **Brief description**

Compact actuator for the operation of final control elements with rotary movement such as valve flaps, ball valves, etc. The torque is transferred via a lever-type actuator or the actuator is directly coupled to the shaft of the final control element. The actuator is controlled using a Contrac electronic unit. This electronic unit serves as the interface between the actuator and the control system.

During continuous positioning, the electronic unit varies the motor torque steplessly until the actuator force and the control valve force are balanced. High response sensitivity and high positioning accuracy with short positioning time ensure an excellent control quality and a long actuator life.

#### Operating principles

The actuator continuously responds to a set point signal. The motor is permanently under voltage (operating mode S9 - 100 % stall-proof according to IEC 60034-1 / EN 60034-1) and gently increases or reduces the torque on the electronic unit in proportion to the  $\Delta Y$  signal (the difference between the Y set point and the Y position signal).

The actuator is not subject to temperature derating, i.e., there are no restrictions, even at the maximum permissible ambient temperature. Where a state of balance exists, the actuator force and process force are equivalent and the actuator keeps the final control element in the required position.

The classification of the 'S9 - 100 % overload protected' Contrac actuator in accordance with IEC 60034-1 / EN 60034-1 by far exceeds the requirements for the highest class, 'continuous modulation, class D' in accordance with EN 15714-2.

The Contrac actuator offers extensive process optimization capabilities thanks to its high-precision and highly dynamic operation.

#### **Rotary actuators**

Rotary actuators are available for nominal actuator torque from 50 to 16000 Nm (40 to 12000 lbf-ft) and feature a common design principle. A motor drives a low-friction, oillubricated spur gearing. At the end of this gearing, a lever mounted on the output drive shaft transmits torque to the final control element via a connecting rod. Since the position sensor is mounted directly on the rear end of the output drive shaft, position feedback is provided without any backlash. This design principle in conjunction with the 3-phase asynchronous motor serves as the basis for the continuous operation mode of the actuator.

Mechanical limit stops, provided on the outside of the gear case, can be adjusted as needed and used to limit the travel path for swing-through valve flaps, for instance.

The handwheel offers an optimum level of performance between handwheel forces and rotational speed, owing to the design principle of the differential gearing. Furthermore, the gear train is not interrupted, even though it is possible to adjust the handwheel at any time. This ensures maximum operational reliability. The 3-phase asynchronous motor is equipped with a spring-loaded brake. The brake is energized in automatic mode. In the case of a fault or failure of the supply voltage, the brake will engage via the spring force and lock the control valve in the current position. This ensures reliable 'Fail-Freeze' action. The brake is maintenance-free, regardless of whether the actuator is controlled via analog, bus, or step controller signals.

# ... Brief description

## Analog signal and power input

For analog control, the set point entry is received from the control system through a 0 to 20 mA or 4 to 20 mA current value. Signal monitoring is possible. Should the signal leave the pre-defined limits, the actuator will perform the set safety procedure (e. g. 'Lock in last position' or 'Drive to safety position').

The position feedback is also given through a 0 to 20 mA or 4 to 20 mA feedback signal. There are 3 digital inputs and 3 digital outputs available in addition to the analog signal. If a digital input is activated, it will take priority over the set point signal (manual mode takes priority over automatic mode).

The following digital input configurations are possible:

| Configuration   | Digital input 1                      | Digital input 2   | Digital input 3    |
|-----------------|--------------------------------------|-------------------|--------------------|
| OFF             | No function                          | No function       | No function        |
| Manual          | Manual mode /                        | Travel command in | Travel command     |
| intervention    | Automatic mode                       | OPEN direction    | in CLOSE direction |
|                 | switching                            |                   |                    |
| Rapid traverse  | Rapid traverse                       | Rapid traverse    | Rapid traverse     |
|                 | mode / Automatic                     | travel command in | travel command in  |
|                 | mode switching                       | OPEN direction    | CLOSE direction    |
| Step controller | ON / OFF step                        | Step controller   | Step controller    |
|                 | controller activation pulses in OPEN |                   | pulses in CLOSE    |
|                 |                                      | direction         | direction          |

The digital output function is freely selectable for each output. The following functions are available:

| Function                          | Description  |
|-----------------------------------|--|
| Ready to operate                  | Signaling of device status.  |
| Signal end position 0 %           | Actuator has reached the 0 % position.   |
| Signal end position 100 %         | Actuator has reached the 100 % position.   |
| Signal limit value 1 rising       | While the signal level is rising, the actuator has reached the position defined as limit value 1.  |
| Signal limit value 1 falling      | While the signal level is falling, the actuator has reached the position defined as limit value 1.   |
| Signal limit value 2 rising       | gWhile the signal level is rising, the actuator has reached the position defined as limit value 2.   |
| Signal limit value 2 falling      | While the signal level is falling, the actuator has reached the position defined as limit value 2.   |
| Collective failure                | Drive function is no longer given. The actuator is no longer available.  |
| Collective alarm                  | Parameters in the Contrac interface system have adopted values, which make a failure in the near future likely. The actuator remains functional. |
| Local operation                   | The actuator is operated via the local control station (ISF)   |
| Rapid traverse + direction        | Actuator is moving at rapid traverse speed in + direction (only for 2-motor version).  |
| Rapid traverse control -direction | Actuator is moving at rapid traverse speed in – direction (only for 2-motor version).  |

### Step controller operation

In the 'step controller' operating mode the incoming control commands are received as pulses at digital inputs 2 and 3 these are upward-integrated into an internal memory. The memory uses these pulses to generate an 'artificial' internal set point which the actuator then follows. This process is as easy on the control valve and actuator operation as the analog control process.

#### Rapid traverse mode

The actuator is operated exactly in the same operating mode as in the analog control mode. On activation of digital inputs 2 or 3, the actuator moves at twice the rated operating speed and half the torque in the corresponding direction. Just before the end position is reached, the actuator travel speed is automatically switched back to the set speed, at which the remaining distance is covered.

#### **Speed**

Contrac actuators offer different speed adjustments for both directions, independently of actuator torque or actuator force. Furthermore, a speed characteristics curve can be set with three different speed values for each direction.

The actuator speed is steplessly adapted to the rate of change in speed of the set point value. This ensures a highly dynamic and extremely precise control process. In order to preserve the control valve, the actuator speed is automatically reduced before the end position is reached.

#### Torque/Force

The torque and actuator force setting options are comparable to the speed setting options. 50 %, 75 % and 100 % of the rated output value can be selected. The electronic unit alters the motor actuation according to the selected value.

#### Set point monitoring

The set point can be monitored for compliance with the adjustable limit values. Should the set point exceed the upper limit value or fall below the lower limit value, the actuator will perform the previously defined safety action. 'Lock in current Position' or 'Move to pre-defined safety position' are available as safety actions.

#### **Ambient conditions**

#### **Temperature**

Different temperature versions are available, depending on the actuator type.

The power-up period is not subject to derating, i.e. even at the maximum permissible ambient temperature, the actuator ensures maximum control precision and dynamics during a power-up period of 100 %.

#### **Corrosion protection**

Contrac actuators and electronic units have been designed for operation in extreme ambient conditions. They satisfy the requirements of atmospheric corrosivity category C5-I (highly polluted industrial atmospheres) for protection against external corrosion in accordance with DIN EN 15714 (Electric actuators for industrial valves – Basic requirements), and EN ISO 12944-2:1998 (Paints and varnishes. Corrosion protection of steel structures by protective paint systems. Classification of environments).

Electronic cabinet modules satisfy the requirements of category C1 (low pollution) as per EN ISO 12944-2:1998 (Paints and varnishes. Corrosion protection of steel structures by protective paint systems. Classification of environments).

#### Service life

Contrac actuators and electronic units exceed the service life requirements for the highest class D, 'continuous modulation', as per DIN EN 15714 (Electric actuators for industrial valves – Basic requirements). The actuators remain maintenance-free for up to 10 years under 'normal' load.

#### Communication

The PROFIBUS DP®, PROFIBUS DP®/V1 or HART® communication protocols are available for digital communication.

#### **PROFIBUS®**

PROFIBUS DP® is an international, open field bus protocol which has been standardized in the field bus standard EN 50170. On a cyclic basis, the master reads the input information from the slaves and writes the output information to the slaves. In addition to this cyclic data transfer of the process representation (e.g. setpoint and actual value), Profibus DP also provides powerful functions for diagnostics and commissioning. PROFIBUS DP/V1 additionally offers the acyclic transfer of data for the configuration of slaves, for example. Data traffic is monitored through the monitoring functions on the master and slave sides. In addition to PROFIBUS® data transfer, ABB Contrac actuators provide two configurable binary outputs to for example signal that the end position has been reached. The two configurable digital outputs can be used independently of the bus communication.

#### **HART®**

Contrac actuators also offer the option of using the HART® communication protocol for configuration and parameterization while operation is in progress. HART®-FSK communication enables simultaneous analog set point transmission and digital communication without additional installation. The HART signal is modulated on to the 4 to 20 mA analog set point signal. The HART® protocol works with Frequency Shift Keying (FSK) technology, based on the Bell 202 communication standard.

#### **DTM**

The DTM (Device Type Manager) for Contrac actuators is based on FDT / DTM technology (FDT 1.2 / 1.2.1) and can either be integrated into a control system or loaded on a PC with DAT200 Asset Vision Basic. This allows you to work with the same user interface in the commissioning phase, during operation, and for servicing tasks, involving monitoring the device, setting parameters, and reading out data.

Communication is based on HART® protocol or PROFIBUS® communication. Reading out data from the device has no effect on the operation in progress. Newly set parameters are saved in the non-volatile memory directly upon download to the device, and become active immediately.

#### EDD

Similar to DTM, the EDD (Electronic Device Description) provides the option of configuration and parameterization of the device through HART® communication by using a handheld terminal or an EDD integrated in the system.

# Use in potentially explosive atmospheres

Explosion proof Contrac actuators are classified as type II devices for operation in potentially explosive atmospheres for days and device category 2.

They are designed for use in Ex zones 1 and 21. Can of course also be used in zones 2 and 22 (for gas and dust atmosphere).

## Thermal motor monitoring

In Contrac control actuators for use in potentially explosive atmospheres, additional independent monitoring of motor temperature is required.

Monitoring can be performed using the ABB SD241-B monitoring unit or a comparable certified tripping unit for thermistor temperature sensors.

The motor temperature monitoring unit interrupts the power supply as soon as the motor temperature up-scales the permissible limit value.

# ... Specification

## **Delivery state**

The standard delivery scope includes metric cable entry threads with IP66 seal plugs. Optional NPT and PG adapters are available. The individual actuator configuration may vary from the standard setup above. This information can be displayed via the user interface. Unless otherwise specified by the user, the electronic units are delivered with the following standard configuration:

| Conventional communication                 |   |
|--|---|
| Parameter                                  | Setting   |
| Function selection                         | Positioner, parameter: set point  |
| Set point function                         | Analog set point  |
| Set point range                            | 4 to 20 mA  |
| Set point characteristic                   | Linear; set point = position value  |
| Actual value range                         | 4 to 20 mA  |
| Nominal torque / rated force in ±direction | 100 %   |
| Automatic speed in ±direction:             | 100 %   |
| Action in 0 % / 100 % end position         | Keep leak-tight with nominal torque / rated force   |
| Digital inputs                             | Digital input 1 Manual / Automatic switching, Digital input 2 / 3 Travel command ±                            |
| Digital outputs                            | Digital output 1 ready for operation / error message, Digital output 2 / 3 end position signaling 0 % / 100 % |
| Brake Away Function                        | Deactivated   |
| Shut-off function                          | Deactivated   |
| Positioning loop monitoring                | Deactivated   |
| Set point monitoring                       | Deactivated   |
| Alarm Type                                 | Deactivated   |
| Action after restoration of powe           | rSwitch to Automatic  |
| Working range of actuator                  | Not set   |

| Signal cable (DCS)                       | 8 mm (0.31 in)  | max. 1.5 mm <sup>2</sup> (16 AWG) |  |  |  |
| Transmitter (option)                     | 8 mm (0.31 in)  | max. 1.5 mm <sup>2</sup> (16 AWG) |  |  |  |
| Motor cable                              | 13 mm (0.51 in) | max. 4 mm <sup>2</sup> (12 AWG)   |  |  |  |
| Sensor cable                             | 8 mm (0.31 in)  | max. 1.5 mm <sup>2</sup> (16 AWG) |  |  |  |

#### Cable glands

The actuators and electronic units are supplied without cable glands. Suited cable glands must be installed on site.

| Tap holes for cable glands |                |            |                   |  |  |  |  |
|----------------------------|----------------|------------|-------------------|--|--|--|--|
|                            | metric         | option     | nal adapters for* |  |  |  |  |
| Signals                    | M20 × 1.5 (2×) | PG 16 (2×) | NPT ½ in (2×)     |  |  |  |  |
| Motor                      | M25 × 1.5 (1×) | PG 21 (1×) | NPT ¾ in (1×)     |  |  |  |  |
| Temperature sensor         | M20 × 1.5 (1×) | PG 16 (2×) | NPT ½ in (2×)     |  |  |  |  |

<sup>\*</sup> Adapter for PG or NPT thread must be ordered separately

#### Note

The on-site cable glands for the motor and signal cables must be produced in type of protection Ex 'e' (increased safety) and must ensure contact with the cable shielding.

#### Selection of suited connection cables

Please observe the following information when selecting cables:

- Use suited cables only for the electric connection between the Contrac control actuator in potentially explosive atmospheres and the components outside of the potentially explosive atmospheres.
- Use shielded cables for the motor / brake cable, the sensor cable, and the signal cable to the control system / controller.
- Connect the shielding of the motor / brake cable and the sensor cable on both sides (to the actuator and to the Contrac electronic unit).
- For the connection between the motor and motor temperature monitoring unit and for the power supply, shielded cables are not required.

# Installation information on the cable harness for actuators in Ex design

The electrical connection between the Contrac electronic unit and the Contrac actuator can be established using the cable set (order code 695). The cable harness is not part of the Ex prototype test certificate and must therefore be tested for safety-relevant functionality within the complete installation by the installer or operator.

If the specified cable harness does not meet all safetyrelevant requirements, the proper installation material must be used.

For the specified motor connection cable, the shielding must be connected at both ends and connected with protective ground.
